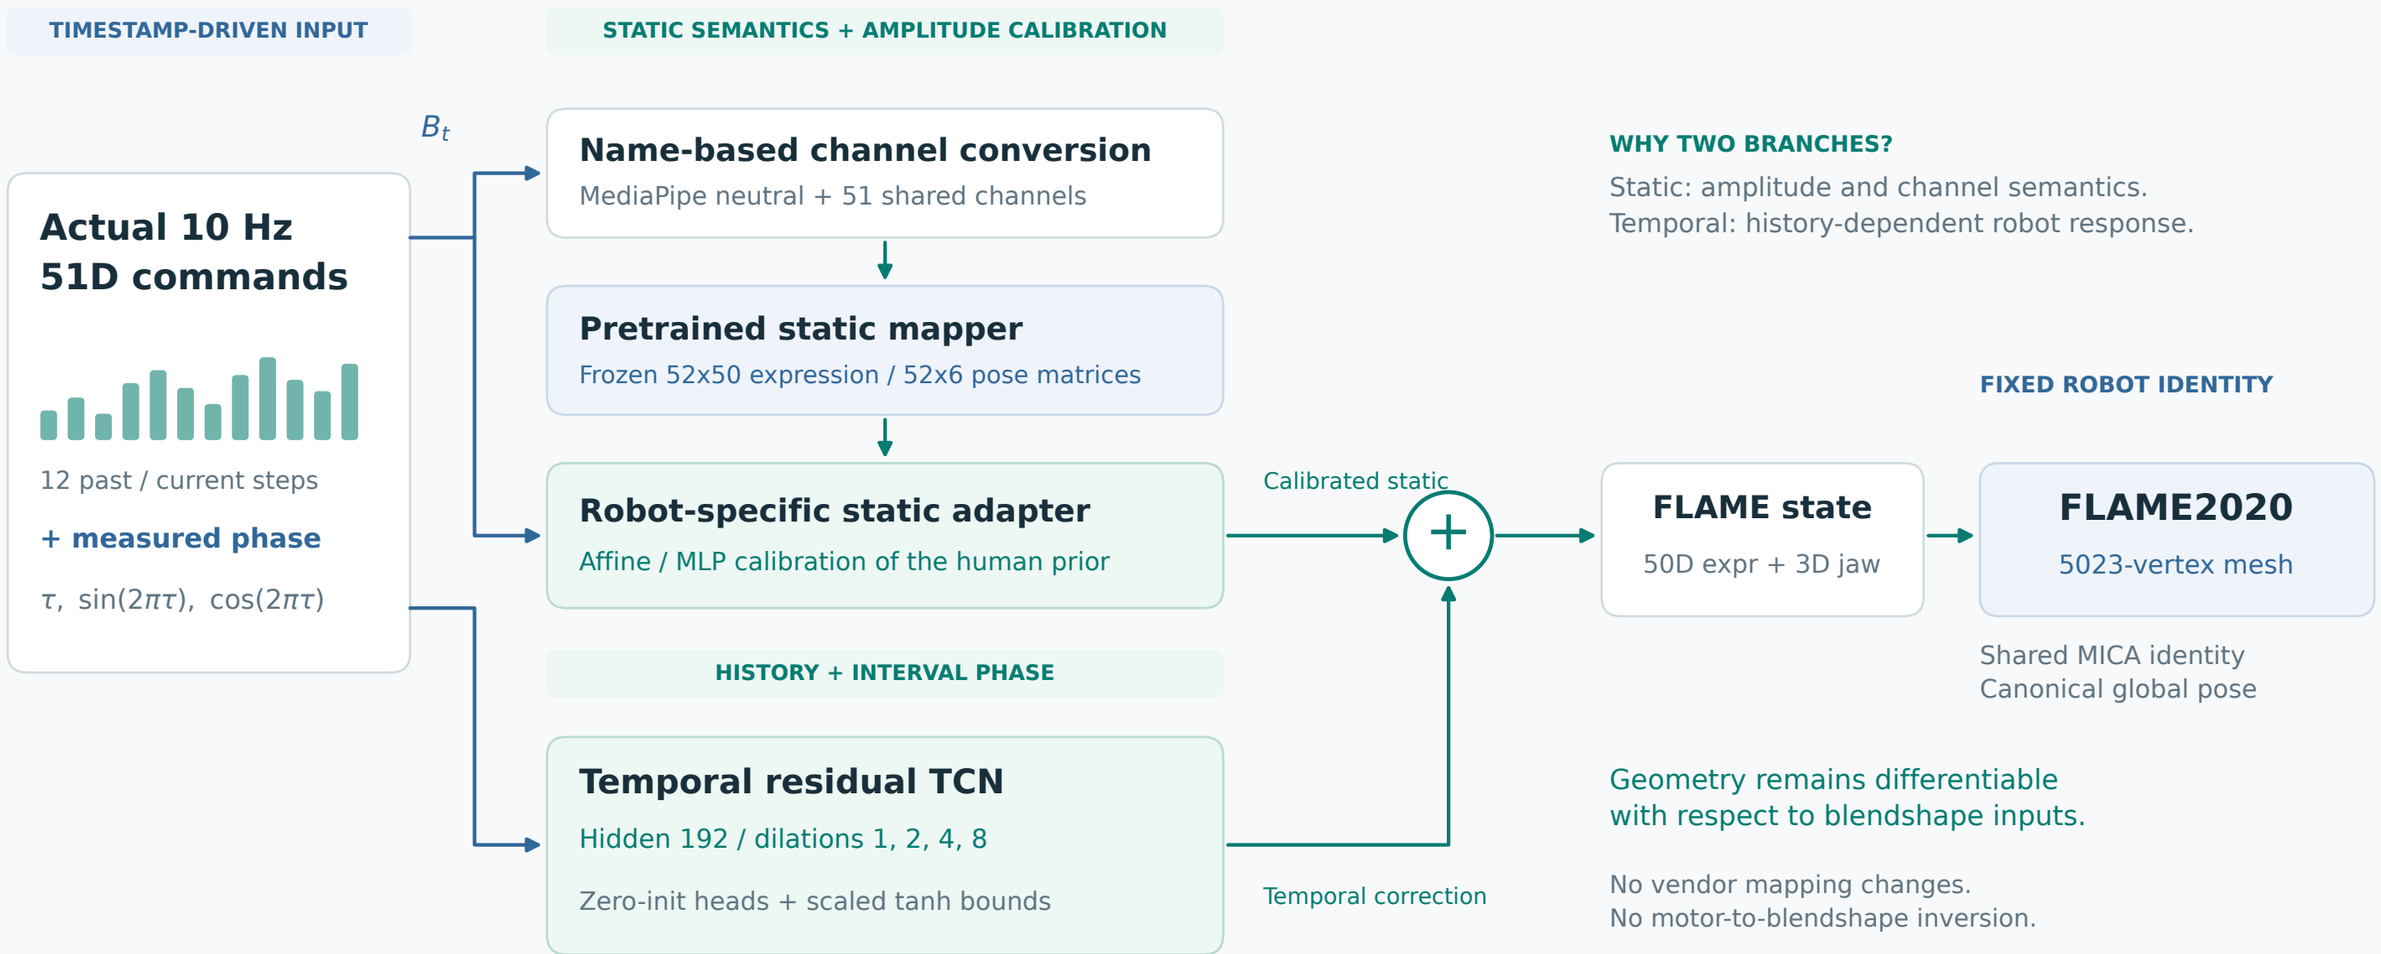
A calibrated prior, with robot-specific dynamics

Blendshape-conditioned Robot-FLAME / frozen static mapping + learned adapter + bounded temporal residual.



$$\hat{y}_t = A_{\text{robot}}(f_{\text{static}}(B_t), B_t) + g_{\text{temporal}}(B_{t-11:t}, \tau_t)$$

FROZEN Pretrained static matrices + FLAME decoder / fixed identity

LEARNED Robot adapter + temporal residual; the adapted Simulator is frozen downstream.

Implementation: src/robot_flame/model.py | Licensed assets / pretrained weights are external.
